Description

SUBSTITUTED 4-AZATRICYCLO[22.3.1.0^{4,9}]OCTACOS-18-ENE DERIVATIVES, THEIR PREPARATION AND PHARMACEUTICAL COMPOSITIONS CONTAINING THEM

FIELD

5

The invention relates to the field of natural product chemistry, in particular the chemistry of macrolides. The invention concerns a compound of formula I

wherein

either

R₁ is hydroxy,

R2 is allyl or n-propyl and

there is a single bond between the carbon atoms numbered 14 and 15

R₁ is missing,

R2 is allyl and

there is a double bond between the carbon atoms numbered 14 and 15.

Formula I is meant to cover the compounds in free form and, where such forms may exist, in salt form.

BACKGROUND ART

Fujisawa EP 184162 discloses a group of compounds represented by formula A

55

40

45

50

wherein

R¹ is hydroxy or protected hydroxy,

R² is hydroxy or protected hydroxy,

30

35

40

45

50

55

60

65

R³ is methyl, ethyl, propyl or allyl,

n is an integer of 1 or 2 and

the symbol of a line and dotted line is a single bond or a double bond, and salts thereof.

As is evident from the above formula, there are many asymmetry centers and therefore, a large number of possible stereoisomers exist for any given meaning of the substituents.

On the other hand, although on page 4 in EP 184 162 it is mentioned that there may be one or more conformer(s) or stereoisomeric pairs such as optical and geometrical isomers due to asymmetric carbon atom(s) and double bond(s), for none of the compounds specifically disclosed in EP 184 162 is there any indication of the exact stereochemical configuration.

This is so in particular for the compound named FK 900506 (FK 506), which is the object of Examples 1 to 3 therein, its derivative hydrogenated at the allyl group to an n-propyl group, which is the object of Example 21 therein, and its derivative dehydrated between positions 14 and 15, which is disclosed in Example 17 therein. From the formula and the names indicated on page 32, 95 and 98 of EP 184 162 it is not apparent what configuration FK 506 and these two derivatives have.

The configuration of FK 506 has however been published in the scientific literature, e.g. in H. Tanaka et al., J. Am. Chem. Soc. 109 (1987) 5031-5033, T. Kino et al., J. Antibiotics 40 (1987) 1249-1255 and T. Taga et al., Acta Cryst. C43 (1987) 751-753.

It appears therefrom that FK 506 and, by implication, the two derivatives thereof mentioned above, have the configuration indicated above for formula I of the present invention, except that at the carbon atom numbered 17 the configuration is reversed, i.e. it is the R configuration, whereas in formula I above the S configuration is shown.

SUMMARY

It has now been found that, surprisingly, the compounds of formula I, which are novel and are the stereoisomers of FK 506, its dihydrogenated derivative and its dehydrated derivative, but with the opposite configuration at the carbon atom in position 17, have an excellent immunosuppressant and antiinflammatory, e.g. antipsoriatic activity.

DETAILED DESCRIPTION

The compounds of formula I are novel. They may be prepared in accordance with standard procedures. The compounds of formula I wherein R₁ is hydroxy and R₂ is allyl (Compound No. 1; "17-epi-FK506") or wherein R₁ is missing and R₂ is allyl (Compound No. 3; "dehydro-17-epi-FK506") may be isolated in known manner from e.g. Streptomyces tsukubaensis No. 9993 using the general procedures described in EP 184 162 and in the Examples hereafter. Thus, an appropriate Streptomyces strain such as Streptomyces tsukubaensis No. 9993 may be cultivated in an appropriate culture medium and the above two compounds isolated from the resultant culture. Cultivation is effected by incubation, e.g. as described in EP 184 162 or in Example 1 hereunder. The pH is kept between about 6 and about 8, preferably at about 6.8. The temperature may vary

between about 18°C and about 35°C, it preferably is kept at around 27°C.

The compound of formula I wherein R₁ is hydroxy and R₂ is n-propyl (Compound No. 2; "dihydro-17-epi-FK506") may e.g. be prepared in known manner by hydrogenation of Compound No. 1, e.g. by catalytic reduction using palladium on charcoal as a catalyst. The temperature may e.g. vary from about 5°C to about 30°C, preferably about room temperature is used. The reaction is preferably effected in the presence of an inert organic solvent such as an alcohol, e.g. ethanol.

Compound No. 3 may e.g. also be prepared in known manner by dehydration of Compound No. 1, e.g. by catalytic dehydration in an acidic solution. Preferably an inert organic solvent such as an ester, e.g. acetic acid ethyl ester, is used. The temperature may vary between about 5°C and about 30°C, the reaction preferably is effected at about room temperature.

The compounds of the invention may be isolated and purified from the reaction or isolation mixture in known manner.

The producing strain, Streptomyces tsukubaensis No. 9993, is disclosed in Fujisawa EP 184162. Samples are available from the Fermentation Research Institute, Tsukuba, Ibaraki 305, Japan under the provisions of the Budapest Treaty, under deposit No. FERM BP-927. This strain has been redeposited on April 27, 1989 with the Agricultural Research Culture Collection International Depository, Peoria, Illinois 61604, USA under the provisions of the Budapest Treaty, under deposit No. NRRL 18488.

Compound No. 1 may e.g. also be produced by total synthesis according to the procedure published for the total synthesis of FK 506 (T.K. Jones et al., <u>J. Am. Chem. Soc.</u> 111 [1989] 1157-1159) using corresponding epimeric starting materials.

The invention thus concerns the compounds of formula I as defined above.

It also concerns a process for the preparation of a compound of formula I as defined above which comprises

a) for the preparation of the compounds of formula I wherein

R₁ is hydroxy or missing and R₂ is allyl,

cultivating an appropriate Streptomyces strain such as

Streptomyces tsukubaensis No. 9993 and isolating the compounds from the resultant mixture,

b) for the preparation of the compound of formula I wherein

R₁ is missing and R₂ is allyl,

dehydrating the corresponding compound of formula I wherein

R₁ is hydroxy or

c) for the preparation of the compound of formula I wherein

R₁ is hydroxy and R₂ is n-propyl,

hydrogenating the corresponding compound of formula I wherein

R₂ is allyl.

The invention also concerns a pharmaceutical composition containing a compound of formula I as defined above together with a pharmaceutically acceptable carrier or diluent.

It also concerns a compound of formula I as defined above for use as a pharmaceutical.

It also concerns the use of a compound of formula I as defined above in the preparation of a pharmaceutical composition, comprising mixing a compound of formula I with a pharmaceutically acceptable carrier or diluent.

It further concerns a process for the preparation of a pharmaceutical composition comprising mixing a compound of formula I as defined above with a pharmaceutically acceptable carrier or diluent.

It further concerns a method for the prevention or treatment of conditions requiring immunosuppression or of inflammatory conditions, comprising administering a therapeutically effective amount of a compound of formula I as defined above together with a pharmaceutically acceptable carrier or diluent to a subject in need of such treatment, e.g. a method of treatment of immune-mediated conditions of the eye comprising topically administering to the eye surface a therapeutically effective amount of a compound of formula I as defined above in a pharmaceutically acceptable ophthalmic vehicle.

EXPLANATION OF THE FIGURES

containing 20 kg silicagel Merck (0.04 to 0.063 mm) using tert-butylmethylether as an eluent. After 50 I of elution, fractions of 6.2 I are collected. Fractions 11 to 13 contain mainly FK506. Fractions 14 to 16 are collected and brought to crystallization by dissolution in 150 ml of ether and addition of 100 ml of hexane. The product is recrystallized from acetonitrile. The title compound (Compound No. 1) is obtained. It has the following characteristics:

- M.P. 180-184°C (dec.) (from methanol, ether or acetonitrile)
- colorless crystals
- $[\alpha]_D^{22} = -4.0^{\circ} (c = 0.72 \text{ in methanol})$

10

- elementary analysis:

found	C 65.6	H 8.7	N 1.8	O 24.0 %
calc.	C 65.7	H 8.7	N 1.7	O 23.9 %

768.5 (MH+-36)

576.3 (MH+-228) 20

100 %

- UV-spectrum in methanol: τ_{max} = end absorption (MeOH)
- IR-spectrum in KBr: see Fig. 1

- 1H-NMR-spectrum in CDCla, 360 MHz with tetramethylsilane as internal standard: see Fig. 2

The structure of this compound has also been analyzed by X-ray diffraction analysis and compared with that for FK 506. The structure was refined to an R factor of 0.046 using 3200 observed reflections. The main insight gained thereby is that the conformation of the 21-membered ring is stabilised by an intramolecular hydrogen bond (010---022) and is significantly different from the ring conformation found in the published crystal structure of FK 506.

b) By fermentation (process variant a), isolation]: After crystallization of FK506 from fractions 11 to 13 (see Example 2) the supernatant is chromatographe over silicagel using hexane/methyl tert-butylether/methanol 5:4:1 as an eluent. The fractions are checked by HPLC and the fraction having a retention time of 17.25 min is rechromatographed over silicagel H with meth tert-butylether. Upon recrystallization from ether the title compound is obtained (M.P. 189-193°C).	ру
The compounds of the invention possess pharmacological activity. They are, of course, indicated for use a	as 40
pharmaceuticals.	
In particular, they possess immunosuppressant and anti-inflammatory activity.	_
As regards immunosuppressant activity, in the mixed lymphocyte reaction [T. Meo, Immunological Method: L. Lefkovits and B. Permis, Eds., Academic Press, N.Y. (1979) p. 227-239], they elicit suppression of mixe	
lymphocytes at a dosage of from about 0.15 nM to about 10 nM. They are further active at a concentration of	
from about 0.5 nM to about 10 nM in the test of the primary humoral immune response on sheep red bloo	
cells in vitro (R.I. Mishell and R.W. Dutton, <u>Science 153</u> [1966] 1004-1006; R.I. Mishell and R.W. Dutton, <u>J. Ex</u> j	ρ.
Med. 126 [1967] 423-442).	
As regards anti-inflammatory activity, in the oxazolone allergy test (mouse) (described in EP 315978) the	
compounds elicit an activity between 20 % and 70 % upon topical administration at a concentration of 0.01 %. The compounds of formula I are therefore indicated as immunosuppressant and antiinflammatory agents for	
use in the prevention and treatment of conditions requiring immunosuppression and of inflammator	
conditions, such as	,
a) the prevention and treatment of	
- resistance in situations of organ or tissue transplantation, e.g. of heart, kidney, liver, bone marrow an	id <i>55</i>
skin,	
- graft-versus-host disease, such as following bone marrow grafts,	
- autoimmune diseases such as rheumatoid arthritis, systemic Lupus erythematosus, Hashimoto	S
thyroidis, multiple sclerosis, Myasthenia gravis, diabetes type I and uveitis, - cutaneous manifestations of immunologically-mediated illnesses, such as Alopecia areata, and	
b) the treatment of inflammatory and hyperproliferative skin diseases, such as psoriasis, atopic	<i>60</i> al
dermatitis, contact dermatitis and further eczematous dermatitises, seborrhoeic dermatitis, Liche	
planus, Pemphigus, bullous Pemphigoid, Epidermolysis bullosa, urticaria, angioedemas, vasculitide:	S,
erythemas, cutaneous eosinophilias, Lupus erythematosus and acne.	
The compounds may be administered systemically or topically	65

For these indications the appropriate dosage will, of course, vary depending upon, for example, the host, the mode of administration and the nature and severity of the condition being treated. However, in general, satisfactory results are indicated to be obtained systemically at daily dosages of from about 0.15 mg/kg to about 1.5 mg/kg animal body weight. An indicated daily dosage is in the range from about 0.01 mg to about 100 mg of a compound of formula I, conveniently administered, for example, in divided doses up to four times a day.

For topical use satisfactory results are obtained with local administration of a 1-3 % concentration of active substance several times daily, e.g. 2 to 5 times daily. Examples of indicated galenical forms are lotions, gels and creams.

The compound of the invention may be administered by any conventional route, in particular enterally, e.g. orally, e.g. in the form of tablets or capsules, or topically, e.g. in the form of lotions, gels or creams.

Pharmaceutical compositions comprising a compound of formula I as defined above in association with at least one pharmaceutical acceptable carrier or diluent may be manufactured in conventional manner by mixing with a pharmaceutically acceptable carrier or diluent. Unit dosage forms contain, for example, from about 0.0025 mg to about 50 mg of a compound of formula I.

Topical administration is e.g. to the skin. A further form of topical administration is to the eye, for the treatment of immune-mediated conditions of the eye, such as: auto-immune diseases, e.g. uveitis, keratoplasty and chronic keratitis; allergic conditions, e.g. vernal conjunctivitis: inflammatory conditions and corneal transplants, by the topical administration to the eye surface of a compound of formula I as defined above in a pharmaceutically acceptable ophthalmic vehicle.

The ophthalmic vehicle is such that the compound of formula I is maintained in contact with the ocular surface for a sufficient time period to allow the compound to penetrate the corneal and internal regions of the eye, e.g. the anterior chamber, posterior chamber, vitreous body, aqueous humor, vitreous humor, cornea, iris/ciliary, lens, choroid/retina and sclera.

The pharmaceutically acceptable ophthalmic vehicle may be e.g. an ointment, vegetable oil, or an encapsulating material.

Compound No. 1 is preferred for the above systemic and topical indications.

Applicant: SANDOZ-ERFINDUNGEN Verwaltungsgesellschaft m.b.H. Brunner Strasse 59 A-1235 Wien(AT)

2 Inventor: Fehr, Theodor Gempenring 40 CH-4143 Dornach(CH)

- Substituted 4-azatricyclo (22.3.1.04.9) octacos-18-ene derivatives, their preparation and pharmaceutical compositions containing them.
- The compounds of formula I

EP 0 356 399 A3

wherein

either

R₁ is hydroxy,

R₂ is allyl or n-propyl and

there is a single bond between the carbon atoms numbered 14 and 15

or

R₁ is missing,

R₂ is allyl and

there is a double bond between the carbon atoms numbered 14 and 15,

have interesting immunosuppressant and anti-inflammatory properties.

They are obtained by fermentation or synthesis, e.g. by hydrogenation or dehydration.

PARTIAL EUROPEAN SEARCH REPORT which under Rule 45 of the European Patent Convention shall be considered, for the purposes of subsequent proceedings, as the European search report
